

VaryForge

VA how-to | make unique vertical video packs

Studio

<https://varyforge-studio-production.up.railway.app>

VaryForge takes one source video and makes a pack of unique vertical variants (1080 x 1920) for Reels / TikTok / Shorts.

Use Fast for daily packs (about 20 variants). HQ is slower AI reconstruct for 1-3 hero clips only -- not a full 20-pack.

1. One-time Drive setup

Do this before anything else. Import, export, and workflows all use the same saved folders.

1. Open Drive in the top nav.
2. Connect Google if it is not already connected.
3. Save at least two folders (paste the Drive folder link + a short name):
 - Inbox -- where raw clips get dropped
 - Output -- where finished variants land
4. You can save more folders (for example one pair per client).

2. Manual pack (Studio)

1. Open Studio.
2. Add videos either from the phone/computer (Browse Camera Roll / Files) or From Google Drive (pick a saved folder, select clips).

Don't mix phone files and Drive clips in the same run.

3. Leave count at 20 unless you want fewer. Leave quality on Fast.
4. Hit Generate. Watch the live run on the right (on phones it pins to the top).
5. Cancel stops the rest of the pack. New run clears the screen so you can start another.

When it finishes, go to Gallery.

First Generate after a quiet stretch can sit 30 seconds to a couple of minutes. That is the GPU waking up -- it is not stuck. After a job, the engine stays warm about 10 minutes.

3. Gallery + send to Drive

1. Open Gallery -- newest packs first.
2. Tap a variant to preview.
3. Select the ones to ship. Toolbar Select all grabs every ok variant, or use per-clip Select N.
4. Send to Drive and pick the output folder.

Only ok variants export. Failed / best-effort ones stay out.

4. Auto workflow (inbox -> pack -> output)

This is the hands-off loop. Drop a clip in Drive; VaryForge makes the pack and puts it in the output folder.

1. Open Workflows.
2. Create one:
 - Name -- e.g. Client A Fast
 - Inbox folder = drop folder
 - Output folder = a different folder (never the same as inbox)
 - Variants per clip: 20
 - Quality: Fast
 - Poll: 2 minutes is fine
 - Turn on Watch folder
3. Drop an .mp4 / .mov directly in the inbox folder -- not inside a subfolder.
4. Within about 2 minutes Studio notices it, generates the pack, and uploads into the output folder as clipname__xxxxxxx/ (variant mp4s + manifest.json).

Run now = check the inbox immediately, don't wait for the next poll.

Notes

- One new clip is processed at a time per workflow. A pile of drops is done across later polls.
- The same file is not processed twice, even if renamed.
- Empty inbox = no GPU cost. Cost starts when a new clip is actually rendered.
- Finished packs also show up in Gallery.

Rules of thumb

Do: Fast + about 20 for daily work

Don't: HQ on a full 20-pack (slow, can hit a 20-min cap)

Do: One workflow per client / folder pair

Don't: Use the same folder for inbox and output

Do: Drop files in the inbox root

Don't: Put clips in nested subfolders (those are ignored)

Do: Gallery -> Send to Drive for one-off picks

Don't: Expect instant GPU -- first clip may wait for a worker to wake

If something looks stuck

- Drive not connected -> Workflows / import / export will refuse. Fix under Drive.
- No new files picked up -> file isn't a video, it's in a subfolder, or it already ran. Hit Run now.
- Generate greyed out -> finish the current pack or tap New run first.
- Need a human: send the Studio URL + which clip + whether it was Studio, Gallery, or Workflows.

That's the whole day-to-day tool: Studio to make packs, Gallery to review/send, Workflows to auto-run off Drive folders.
